

Appl. No. 10/075,894

Reply to Office Action of December 29, 2003

Amendments to the Claims:

1. (currently amended) A stator for a rotating electrical machine, comprising:
a stator core having an outer circumferential surface and an opening therethrough that forms an inner circumferential surface;
at least two longitudinal slots formed in the inner circumferential surface of the stator core; and
at least one stator coil having a first slot-insertion segment and a second slot-insertion segment interposed by a non-slot-insertion segment, the first and second slot-insertion segments extending parallel to one another in a first plane and inserted, one each, within a separate slot, the non-slot-insertion segment having an non-twisted apex at a predetermined position thereon, and a first non-twisted segment and a second non-twisted segment interposed by a twisted segment, the first and second non-twisted segments each having a non-twisted section adjacent the first and second slot-insertion segments, respectively,
wherein the twisted segment is twisted a predetermined number of degrees and includes at least a portion thereof that is bent at a predetermined angle relative to a second plane that is parallel to the first plane.

2. (currently amended) The stator of Claim 1, wherein the non-slot-insertion segment is generally V-shaped ~~and includes an apex at a predetermined position thereon.~~

3. (currently amended) The stator of Claim 2, wherein the non-twisted apex is located on the twisted segment.

4. (original) The stator of Claim 1, wherein the non-slot-insertion segment extends in a direction away from the first and second slot-insertion segments generally toward the outer circumference of the stator core.

Appl. No. 10/075,894

Reply to Office Action of December 29, 2003

5. (original) The stator of Claim 1, wherein the predetermined number of degrees of the twist is approximately 180° .

6. (original) The stator of Claim 1, wherein the predetermined angle of bend is approximately 45° .

7. (cancelled).

8. (cancelled).

9. (cancelled).

10. (cancelled).

11. (cancelled).

12. (currently amended) A rotating electrical machine, comprising:

a rotationally mounted rotor; and

a stator surrounding the rotor, the stator including:

a stator core having an outer circumferential surface and an opening therethrough that forms an inner circumferential surface,

at least two longitudinal slots formed in the inner circumferential surface of the stator core, and

at least one stator coil having a first slot-insertion segment and a second slot-insertion segment interposed by a non-slot-insertion segment, the first and second slot-insertion segment extending parallel to one another in a first plane and inserted, one each, within a separate slot, the non-slot-insertion segment having, a non-twisted apex and a first non-twisted segment and a second non-twisted segment interposed by a twisted segment, the first and second non-twisted

segments each having a non-twisted section adjacent the first and second slot-insertion segments, respectively,

wherein the twisted segment is twisted a predetermined number of degrees and includes at least a portion thereof that is bent at a predetermined angle relative to a second plane that is parallel to the first plane.

13. (currently amended) The machine of Claim 12, wherein the non-slot-insertion segment is generally V-shaped ~~and includes an apex at a predetermined position thereon.~~

14. (currently amended) The machine of Claim 13, wherein the non-twisted apex is located on the twisted segment.

15. (original) The machine of Claim 12, wherein the non-slot-insertion segment extends in a direction away from the first and second slot-insertion segments generally toward the outer circumference of the stator core.

16. (original) The machine of Claim 12, wherein the predetermined number of degrees of the twist is approximately 180°.

17. (original) The machine of Claim 12, wherein the predetermined angle of bend is approximately 45°.

18. (original) The machine of Claim 12, wherein the machine is configured as a generator.

19. (original) The machine of Claim 12, wherein the machine is configured as a motor.

20. (currently amended) A coil for insertion into a stator core, comprising:
a first slot-insertion segment extending in a first plane;

a second slot-insertion segment extending parallel to the first slot-insertion segment in the first plane; and

a non-slot-insertion segment coupled to the first and second slot-insertion segments together, the non-slot-insertion segment having a non-twisted apex, and a first non-twisted segment and a second non-twisted segment interposed by a twisted segment, the first and second non-twisted segments each having a non-twisted section adjacent the first and second slot-insertion segments, respectively,

wherein the twisted segment is twisted a predetermined number of degrees and includes at least a portion thereof that is bent at a predetermined angle relative to a second plane that is parallel to the first plane.

21. (currently amended) The coil of Claim 20, wherein the non-slot-insertion segment is generally V-shaped ~~and includes an apex at a predetermined position thereon.~~

22. (currently amended) The coil of Claim 21, wherein the non-twisted apex is located on the twisted segment.

23. (original) The coil of Claim 20, wherein the non-slot-insertion segment extends in a direction away from the first and second slot-insertion segments.

24. (original) The coil of Claim 20, wherein the predetermined number of degrees of twist is approximately 180°.

25. (original) The coil of Claim 20, wherein the predetermined angle of the bend is approximately 45°.

26. (withdrawn) A method of assembling a stator core for a rotating electrical machine, the method comprising:

providing a stator core having an outer circumferential surface and an opening therethrough that forms an inner circumferential surface;

Appl. No. 10/075,894

Reply to Office Action of December 29, 2003

forming at least two longitudinal slots in the inner circumferential surface of the stator core;

providing at least one stator coil having:

a first slot-insertion segment extending in a first plane;

a second slot-insertion segment extending parallel to the first slot-insertion segment in the first plane; and

a non-slot-insertion segment coupled to the first and second slot-insertion segments together, the non-slot-insertion segment having a first non-twisted segment and a second non-twisted segment interposed by a twisted segment, wherein the twisted segment is twisted a predetermined number of degrees and includes at least a portion thereof that is bent at predetermined angle relative to a second plane that is parallel to the first plane; and

inserting the first and second slot-insertion segments, one each, within a separate slot.
